Contents

- 1 Introduction
- 2 LLVM framework quick start

Understanding LLVM

LLVM is not a compiler.

Understanding LLVM

LLVM is not a compiler.

LLVM is a collection of components
which is useful to build a compiler.

Getting LLVM

- “old” git mirrors
 - only llvm repo (subprojects in separated repos, can be added later)
 - `git clone -b release_80 -single-branch git@github.com:llvm-mirror/llvm.git`

- “new” git monorepo
 - all in one repo (llvm + major subprojects)
 - `git clone -b release/8.x -single-branch git@github.com:llvm/llvm-project.git`

What LLVM is made of

- C++ libraries
 - `src/include/llvm/...`
 - `src/lib/...`

- small application (tools)
 - `src/tools/...`
 - `src/utils/...`

You can find binaries of them in the installation directory under `root/bin/...`

clang

- **clang** is a compiler based on LLVM
- It compiles all major C-like languages

- It is part of the git monorepo
- It can be added as a tool in the LLVM framework but must be manually cloned in the tool directory
 - 1 `cd src/tools`
 - 2 `git clone http://llvm.org/git/clang` (git mirror version)

- You can easily see on a production quality compiler the impact of changes you made on your local copy of LLVM

Commands

`llvm-as` LLVM assembler

`llvm-dis` LLVM disassembler

`opt` LLVM optimizer

`llc` LLVM static compiler

`lli` directly execute programs from LLVM bitcode

`llvm-link` LLVM bitcode linker

`llvm-mca` LLVM machine code analyzer

`llvm-nm` list LLVM bitcode and object file's symbol table

`llvm-stress` generate random .ll files

`llvm-config` prints out install configuration parameters

`llvm-dwarfdump` print contents of DWARF sections

For a complete reference, see LLVM command guide ¹

Writing a LLVM pass

There are a lot of tutorials available:

- Official developer guide
llvm.org/docs/WritingAnLLVMPass
- Out-of-source pass
github.com/quarkslab/llvm-dev-meeting-tutorial-2015

We will follow the first one, with a few adjustments.

Testing

LLVM has an internal testing infrastructure. ² Please use it.

`llvm-lit` LLVM Integrated Tester

- 1 Forge a proper LLVM-IR input file (.ll) for your test case
- 2 Instrument it with `lit` script comments
- 3 Run `lit` on your test
 - `llvm-lit /llvm/test/myTests/singleTest.ll`
run a single test
 - `llvm-lit /llvm/test/myTests`
run the test suite (folder)
- 4 Run `lit` on the LLVM test suite (regression testing)

To submit a bug report to LLVM developers you will be asked to write a `lit` test case that highlights the bug.
